mitted (DEC-2002) to the EMBL/GenBank/DDS databases.
FUNCTION: Catalyzes the NADP-dependent rearrangement and
of 1-deoxy-D-xylulose-5-phosphate (DXP) to 2-C-methyl-D-
4-phosphate (MEP) (By similarity).
CATALYTIC ACTIVITY: 2-C-methyl-D-erythritol 4-phosphate
= 1-deoxy-D-xylulose 5-phosphate + NADPH.

PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; s

iture 404:502-506(2000).
i PULNCTION. Catalyzes the NADP-dependent rearrangement and reduction
of 1-deoxy-D-xylulose-5-phosphate (DXP) to 2-C-methyl-D-erythritol
4-phosphate (MEP) (By similarity).
i CATALYTIC ACTIVITY: 2-C-methyl-D-erythritol 4-phosphate + NADP(+)
i - PATHMAY: Nonmevalonate terpenoid biosynthesis pathway; second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tween the Swiss Institute of Bioinformatics and the EMBL outstation be European Bioinformatics Institute. Procent Replace of Pasteurella multocida Pm70.";
Proc. Natl. Acad. Sci. U.S.A. 98:3460-3465(2001).

-i. FUNCTION: Catalyzes the NADP-dependent rearrangement and reduction of 1-deoxy-D-xylulose-5-phosphate (DXP) to 2-c-methyl-D-erythritol
4-phosphate (MEP) (By similarity).

-i. CATALYTIC ACTIVITY: 2-C-methyl-D-erythritol 4-phosphate + NADP(+)
                                                                                                                                                                                                                                                 SEQUENCE PROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    FUNCTION: Catalyzes the NADP-dependent rearrangement and reductio of 1-deoxy-D-xylulose-5-phosphate (DXP) to 2-C-methyl-D-erythrito 4-phosphate (MEP) (By similarity).

CATALYTIC ACTIVITY: 2-C-methyl-D-erythritol 4-phosphate + NADP(+) = 1-deoxy-D-xylulose 5-phosphate + NADPH.

PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; second
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY: BELONGS TO THE DXR FAMILY.
